

Health Intelligence Report

Patient: Sarah Chen
Generated: May 5, 2026

NOTICE: This report identifies patterns in health data to support informed conversations with a healthcare provider. It is not a medical diagnosis. Always consult a qualified clinician.

SUMMARY

Your health records show a pattern of improving iron stores and stable thyroid function over the past 6 months. Your ferritin has risen from 8 ng/mL to 12 ng/mL, suggesting your iron supplementation is working. Your TSH has normalized from 5.8 to 3.2 mIU/L with your current levothyroxine dose. One area to discuss with your doctor: your Vitamin D level of 18 ng/mL is below the recommended range.

PATTERNS IDENTIFIED

Iron Levels Improving But Still Worth Watching

Confidence: Possible pattern

RELATED CONDITIONS

Iron Deficiency Anemia · Fatigue

SUPPORTING EVIDENCE

- Ferritin 8 ng/mL (below range) — Dr. Lisa Nguyen Lab Report, 3 months ago
- Ferritin 12 ng/mL (low-normal) — Dr. James Park Annual Physical, 1 month ago
- Hemoglobin 11.8 g/dL (slightly below range) — Dr. James Park Annual Physical, 1 month ago

Thyroid Function Stabilizing

Confidence: Strong pattern

RELATED CONDITIONS

Hypothyroidism · Hashimoto's Thyroiditis

SUPPORTING EVIDENCE

- TSH 5.8 mIU/L (above range) — Dr. Emily Roberts, 6 months ago
- TSH 3.2 mIU/L (within range) — Dr. James Park Annual Physical, 1 month ago

Low Vitamin D Detected

Confidence: Strong pattern

RELATED CONDITIONS

Vitamin D Deficiency · Bone Health · Fatigue

SUPPORTING EVIDENCE

- Vitamin D 18 ng/mL (below recommended 30 ng/mL) — Dr. James Park Annual Physical, 1 month ago

INFORMATION GAPS

- No recent complete metabolic panel found
- No B12 level on record — low B12 can cause similar symptoms to iron deficiency
- Thyroid antibody tests (TPO Ab) not found — relevant given family history of Hashimoto's

TALKING POINTS FOR YOUR PROVIDER

- Your iron stores have improved with supplementation, but are still at the low end of normal. Consider asking your doctor how long to continue supplementation and when to retest.
- Your thyroid levels have improved significantly on your current medication dose. Ask your endocrinologist whether your upcoming appointment will lead to any dose adjustments.
- Your Vitamin D is below the recommended range. This is common but worth addressing — ask your doctor about supplementation, as low Vitamin D can contribute to fatigue and affects many body systems.
